SKY OBSERVATIONS

Date _____ Time _____

Location _____

I've made these observations over a few nights, trying to find some old constellations. I wish you could see this sky with me.

For each constellation, I've made a handy guide to help me find it later. You just need to find its main star, then line up the marked corners with the stars.

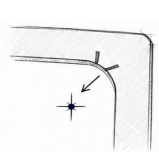

That should help you find all the stars in each constellation.

The first night, I was able to see Lyra. You just have to find Vega.

The second night, I saw Cygnus with the help of Deneb.

The last night, I found Aquila, all thanks to Altair.

Take your time. There's a lot to notice when you look up.
